# Our recent activities

# **Exotic hadrons beyond qqq and qq**<sup>bar</sup> Phenomena near and above thresholds Hadronic molecules

Heavy quarks to disentangle correlations Hadrons are strongly correlated systems What are the effective degrees of freedom Constituent quarks, diquarks, glueons<sup>\*</sup>, ...

# I. Exotic hadrons beyond $q\bar{q}$ , qqq

# 1. Introduction

QED: Lagrangian is *simple* and physics is *understandable* 

$$L = \overline{\psi} \left( i \not\partial + e \notA - m \right) \psi - \frac{1}{4} F^2$$

Can be a small parameter

QCD: Lagrangian is *simple* BUT physics is *not easy* 

$$L = \sum_{f} \overline{q}_{f} \left( i \not\partial + g \notA - m_{f} \right) q_{f} - \frac{1}{4} F^{2}$$
  
Depends on the physics scale

# **Basic features**

- Elementary quarks and gluons are not observed/confined
- Observed hadrons are composites of strongly correlated quarks-gluons
- Vacua for quarks and hadrons are different→Phase structure
- Hadron properties are environment/vacuum dependent

- Chiral symmetry breaking quark condensate - Scale invariance violation gluon condensate - Topological density instanton vacuum - Color confinement Polyakov loop

 $\langle \bar{q}q \rangle \neq 0$ 

$$\langle G_{\mu\nu}G_{\mu\nu}\rangle \neq 0$$

$$\left\langle G_{\mu\nu}\tilde{G}_{\mu\nu}\right\rangle \neq 0$$
  
 $\left\langle \mathcal{P}\exp\left(i\int d\tau A_4\right)\right\rangle = 0$ 

### Phases in QCD

![](_page_14_Figure_1.jpeg)

# Spectroscopy

- Ground states are well described (lattice)
- Excited states/resonances are less described
- ➡ Reactions (productions and decays) are neither

Focus on

• Why many hadrons are qqq and qq<sup>bar</sup>?

### Ground states are well described (lattice)

#### A SCHEMATIC MODEL OF BARYONS AND MESONS

M. GELL-MANN

California Institute of Technology, Pasadena, California

Received 4 January 1964

anti-triplet as anti-quarks  $\bar{q}$ . Baryons can now be constructed from quarks by using the combinations (q q q),  $(q q q q \bar{q})$ , etc., while mesons are made out of  $(q \bar{q})$ ,  $(q q \bar{q} \bar{q})$ , etc. It is assuming that the lowest baryon configuration (q q q) gives just the representations 1, 8, and 10 that have been observed, while the lowest meson configuration  $(q \bar{q})$  similarly gives just 1 and 8.

## Why many hadrons are qqq and qq<sup>bar</sup>?

## LHCb confirmed the tetraquark Z+(4430)

http://www.theguardian.com/science/life-and-physics/2014/apr/13/quarks-bonding-differently-at-lhcb

![](_page_24_Picture_2.jpeg)

So until last week there were two known types of hadron.

LHCb has just confirmed what data from other experiments had already led us to suspect. There is a third way.

Three-body decay

### Invariant mass of πY(nS)

![](_page_42_Figure_1.jpeg)

Seminar at Vladivostok, March 28,29, 2016

# Unique features of Z<sub>b</sub> resonances

- States appear near the thresholds
- Masses of  $Z_b(10610)$ ,  $Z_b(10650)$  are similar
- Heavy spin changing processes occur

# $\begin{array}{ccc} \Upsilon(5S) \rightarrow & Z_b \rightarrow & \Uparrow \Upsilon \pi \\ \bigstar & & h_b \pi & \checkmark \end{array}$

HQ forbidden process occurs equally with allowed ones Explained by BB\* molecules

# $Z_b$ as a $B\overline{B}^*$ molecules

Bondar et al, Phys.Rev. D84 (2011) 054010 Ohkoda, Yamaguchi, Yasui, Sudoh and Hodaka, Phys.Rev. D86 (2012) 014004

- 1. Masses
- 2. Transitions: Heavy quark selection rules
- 3. Decays into bottomonium

# Summary

- Many new hadrons are found beyond qqq and  $q\overline{q}$
- Multiquarks may form hadronic molecules
- Coupled channel dynamic is crucial near the threshold
- Further to be studied Hadron-hadron interactions Diquarks, gluons, compact multiquarks...
